### APPENDIX A DERIVATION OF MODEL FOR TWO-INVERTER-INFINITE-BUS SYSTEM

$$\begin{aligned} X_{\Delta 12} &= \frac{X_1 X_2 + X_1 X_g + X_2 X_g}{X_g} \\ X_{\Delta g1} &= \frac{X_1 X_2 + X_1 X_g + X_2 X_g}{X_2} \\ X_{\Delta g2} &= \frac{X_1 X_2 + X_1 X_g + X_2 X_g}{X_1} \\ X_{\Sigma 1} &= X_1 + X_g, X_{\Sigma 2} = X_2 + X_g \\ X_{1+2//g} &= X_1 + \frac{X_g X_2}{X_{\Sigma 2}}, X_{2+1//g} = X_1 + \frac{X_g X_1}{X_{\Sigma 1}} \end{aligned} \quad (A1)$$

#### A. The expression of Both IBRs are GFM inverters

$$\begin{cases} \dot{\delta}_1 = k_{\text{droop}1} [P_{1ref} - \frac{V_1 V_2 \sin(\delta_1 - \delta_2)}{X_{\Delta 12}} - \frac{V_1 U_g}{X_{\Delta g1}} \sin \delta_1] \\ \dot{\delta}_2 = k_{\text{droop}2} [P_{2ref} - \frac{V_1 V_2 \sin(\delta_2 - \delta_1)}{X_{\Delta 12}} - \frac{V_2 U_g}{X_{\Delta g2}} \sin \delta_2] \end{cases} \quad (A2)$$

where  $\delta_1, \delta_2$ , and  $P_{1ref}, P_{2ref}$  represent the power angles, and the power references of the two GFM inverters respectively.  $V_1$  and  $V_2$  are the voltages of two GFM inverters.

#### B. The expression of Both IBRs are GFL inverters

$$\begin{cases} \dot{\delta}_1 = k_{\text{PLL}1} [X_{\Sigma 1} I_{d1} + X_g I_{d2} \cos(\delta_2 - \delta_1) - U_g \sin \delta_1] \\ \dot{\delta}_2 = k_{\text{PLL}1} [X_{\Sigma 2} I_{d2} + X_g I_{d1} \cos(\delta_1 - \delta_2) - U_g \sin \delta_2] \end{cases} \quad (A3)$$

where  $\delta_1, \delta_2$ , and  $I_{d1}, I_{d2}$  represent the angles of PLL, and the current references on  $d$ -axis of the two GFL inverters respectively.

#### C. The expression of IBR1 is GFL inverter and IBR2 is GFM inverter

$$\begin{cases} \dot{\delta}_1 = k_{\text{PLL}} \left[ X_{1+2//g} I_{d1} - \frac{X_g V_2}{X_{\Sigma 2}} \sin(\delta_1 - \delta_2) - \frac{X_2 U_g}{X_{\Sigma 2}} \sin \delta_1 \right] \\ \dot{\delta}_2 = k_{\text{droop}} \left[ P_{ref} + \frac{X_g I_{d1} V_2}{X_{\Sigma 2}} \cos(\delta_1 - \delta_2) - \frac{U_g V_2}{X_{\Sigma 2}} \sin \delta_2 \right] \end{cases} \quad (A4)$$

#### D. The expression of IBR1 is GFL inverter and IBR2 is GSP inverter

$$\begin{cases} \dot{\delta}_1 = k_{\text{PLL}1} \left[ X_{1+2//g} I_{d1} - \frac{X_g V_{ref}}{X_{\Sigma 2}} \sin(\delta_1 - \delta_2) - \frac{X_2 U_g}{X_{\Sigma 2}} \sin \delta_1 + \epsilon_{lp}(k_v, k_{\text{PLL}2}, (\delta_1 - \delta_2)) \right] \\ \dot{\delta}_2 = k_{\text{PLL}2} [X_{\Sigma 2} I_{d2} + X_g I_{d1} \cos(\delta_1 - \delta_2) - U_g \sin \delta_2] \end{cases} \quad (A5)$$

where

$$\begin{aligned} \epsilon_{lp} &= \epsilon_v g_1 (\delta_1 - \delta_2) + \epsilon_{\text{PLL}} h_1 (\delta_1 - \delta_2) \\ g_1 (\delta_1 - \delta_2) &= \frac{X_g}{X_{\Sigma 2}} V_{ref} \sin(\delta_1 - \delta_2) + \frac{X_g}{X_{\Sigma 2}} U_g \cos \delta_2 \sin(\delta_2 - \delta_1) + \frac{X_g^2}{X_{\Sigma 2}} I_{d1} \sin(\delta_2 - \delta_1)^2 \\ h_1 (\delta_1 - \delta_2) &= \frac{X_g}{X_{\Sigma 2}} \cos(\delta_1 - \delta_2) \end{aligned} \quad (A6)$$

In (A6), the definition of  $\epsilon_v \triangleq 1/(k_v X_{\Sigma 2} + 1)$  represents the voltage control error. The  $\epsilon_{\text{PLL}} \triangleq \dot{\delta}_2/k_{\text{PLL}2} = v_{q2}$  represents dynamics of the difference between the angle of PLL in IBR2 and its steady state. When  $k_{\text{PLL}2}$  is large enough, which means that the dynamic of PLL in IBR2 is much faster than PLL1 in IBR1, the perturbed term  $\epsilon_{\text{PLL}}$  can be regarded as zero. Also, when the voltage control gain  $k_v$  is large enough, indicating more effective voltage control with smaller error, the term  $\epsilon_v$  is approximately 0. Under this case ( $\epsilon_v \approx 0, \epsilon_{\text{PLL}} \approx 0$ ), the sets of Equations (A4) and (A5) are identical, and they share the same form as shown in Eq. (3) in the paper.

#### E. The expression of IBR1 is GFM inverter and IBR2 is GSP inverter

$$\begin{cases} \dot{\delta}_1 = k_{\text{droop}} \left[ P_{ref} - \frac{V_{ref} V_1 \sin(\delta_1 - \delta_2)}{X_{\Delta 12}} - \frac{V_1 U_g \sin \delta_1}{X_{\Delta g1}} + \epsilon_{mp}(k_v, k_{\text{PLL}}, (\delta_1 - \delta_2)) \right] \\ \dot{\delta}_2 = k_{\text{PLL}} \left[ X_{2+1//g} I_{d2} - \frac{X_g V_1}{X_{\Sigma 1}} \sin(\delta_2 - \delta_1) - \frac{X_2 U_g}{X_{\Sigma 1}} \sin \delta_2 \right] \end{cases} \quad (A7)$$

where

$$\begin{aligned} \epsilon_{mp} &= \epsilon_v g_2 (\delta_1 - \delta_2) + \epsilon_{\text{PLL}} h_2 (\delta_1 - \delta_2) \\ g_2 (\delta_1 - \delta_2) &= -\frac{X_g}{X_{\Delta 12} X_{\Sigma 1}} V_1^2 \cos(\delta_1 - \delta_2) \sin(\delta_1 - \delta_2) - \frac{X_1}{X_{\Delta 12} X_{\Sigma 1}} V_g V_1 \cos \delta_2 \sin(\delta_1 - \delta_2) + \frac{V_1 V_{ref}}{X_{\Delta 12}} \sin(\delta_1 - \delta_2) \\ h_2 (\delta_1 - \delta_2) &= \frac{V_1 \cos(\delta_1 - \delta_2)}{X_{\Delta 12}} \end{aligned} \quad (A8)$$

In (A8), the definition of  $\epsilon_v \triangleq 1/(k_v X_{2+1//g} + 1)$  represents the voltage control error. The  $\epsilon_{\text{PLL}} \triangleq \dot{\delta}_2/k_{\text{PLL}} = v_{q2}$  represents dynamics of the difference between the angle of PLL in IBR1 and its steady state. When  $k_{\text{PLL}}$  is large enough, which means that the dynamic of PLL is much faster than GFM,

the perturbed term  $\epsilon_{PLL}$  can be regarded as zero. Also, when the voltage control gain  $k_v$  is large enough, indicating more effective voltage control with smaller error, the term  $\epsilon_v$  is approximately 0. Under this case ( $\epsilon_v \approx 0$ ,  $\epsilon_{PLL} \approx 0$ ), the sets of Equations (A7) and (A2) are identical, and they share the same form as shown in Eq. (3) in the paper.

## APPENDIX B EMT SIMULATION PARAMETERS

Fig. 2. Two-inverter system and detailed configurations used in EMT simulation.

TABLE B1  
SYSTEM PARAMETERS IN TWO PARALLELED GFL INVERTERS SYSTEM

| Parameters                              | Value (p.u.)      |
|---|-------------------|
| Base frequency $\omega_s$               | 50 Hz             |
| Grid voltage $U_g$                      | 1                 |
| DC voltage $U_{dc}$                     | 2.5               |
| LCL Filter impedance $L_f j + r_f$      | $0.2j + 0.002$    |
| LCL Filter capacitance $C_f$            | 0.01              |
| Inner current control loop bandwidth    | 1 kHz             |
| PLL controller of IBR1 $k_{PLL1}$       | $10 \times 2\pi$  |
| PLL controller of IBR1 $k_i$            | $2\pi$            |
| PLL controller of IBR2 $k_{PLL2}$       | $10 \times 2\pi$  |
| PLL controller of IBR2 $k_i$            | $2\pi$            |
| Frequency limit of PLL $\omega_{limit}$ | $\pm 0.2$         |
| Current reference of IBR1 $I_{d1}$      | 0.8               |
| Current reference of IBR2 $I_{d2}$      | 0.4               |
| Line impedance $Z_1$                    | $0.2j + 0.002$    |
| Line impedance $Z_2$                    | $0.2j + 0.002$    |
| Line impedance $Z_g$                    | $0.35j$ or $0.4j$ |
| Fault resistance $R_f$                  | 0.02              |

TABLE B2  
SYSTEM PARAMETERS IN GFL - GFM(GSP) INVERTERS SYSTEM

| Parameters                                | Value (p.u.)                                 |
|---|--|
| Base frequency $\omega_s$                 | 50 Hz  |
| Grid voltage $U_g$                        | 1  |
| Impedance $Z_1$                           | $0.5j + 0.025$                               |
| Impedance (include virtual one) $Z_2$     | $0.1j + 0.002$                               |
| Impedance $2Z_g$                          | $0.6j + 0.03$                                |
| Fault resistance $R_f$                    | 0.001  |
| Fault position (from the infinite bus)    | 0.8  |
| IBR1 - GFL                                |  |
| Inner current control loop bandwidth      | 1 kHz  |
| PLL controller $k_{PLL1}$                 | $2.5 \times 2\pi$                            |
| PLL controller $k_i$                      | $0.25 \times 2\pi$                           |
| Frequency limit of PLL $\omega_{limit}$   | $\pm 0.2$                                    |
| Current reference $I_{d1}$                | 1  |
| DC voltage $U_{dc}$                       | 2.5  |
| LCL filter impedance $L_f j + r_f$        | $0.2j + 0.02$                                |
| LCL filter capacitance $C_f$              | 0.01   |
| IBR2 - GFM                                |  |
| $p - \omega$ droop gain $k_{droop}$       | $2.5 \times 2\pi$                            |
| Power reference $P_{ref}$                 | 0.6 in Section IV-A,<br>0 in Section IV-B    |
| AC Voltage $V_2$                          | 1  |
| Inner voltage control loop bandwidth      | 200 Hz                                       |
| Inner current control loop bandwidth      | 1 kHz  |
| LCL filter impedance $L_f j + r_f$        | $0.2j + 0.02$                                |
| LCL filter capacitance $C_f$              | 0.1  |
| Current limit $I_{limit}$                 | 5  |
| $p - \omega$ droop time constant $\tau_p$ | $1/(25 \times 2\pi)$                         |
| IBR2 - GSP                                |  |
| Voltage droop $k_v$                       | 1 or 4 in Section IV-A,<br>2 in Section IV-B |
| Voltage reference $V_{ref}$               | 1  |
| Current reference $I_{d2}$                | 0.6 in Section IV-A,<br>0 in Section IV-B    |
| Voltage droop filter time scale $\tau_v$  | $1/(50 \times 2\pi)$                         |
| PLL controller $k_{PLL2}$                 | $k_{droop} \cdot \frac{1}{X_{\Sigma 2}}$     |

TABLE B3  
SYSTEM PARAMETERS IN THE GFM - GSP INVERTERS SYSTEM

|  |                      |
|--|----------------------|
| Impedance $Z_1$                            | $0.5j + 0.025$       |
| Impedance $Z_2$                            | $0.1j + 0.002$       |
| Impedance $2Z_g$                           | $0.6j + 0.03$        |
| Fault resistance $R_f$                     | 0.001                |
| Fault position (from the infinite bus)     | 0.8                  |
| IBR1 - GFM                                 |                      |
| $p - \omega$ droop gain $k_{droop}$        | $2.5 \times 2\pi$    |
| Power reference $P_{ref}$                  | 0.8                  |
| AC Voltage $V_1$                           | 1                    |
| Inner voltage control loop bandwidth       | 200 Hz               |
| Inner current control loop bandwidth       | 1 kHz                |
| Current limit $I_{limit}$                  | 5                    |
| $p - \omega$ droop time constant $\tau_p$  | $1/(25 \times 2\pi)$ |
| IBR2 - GSP                                 |                      |
| voltage control gain $k_v$                 | 0, 2, or 4           |
| Voltage reference $V_{ref}$                | 1                    |
| Current reference $I_{d2}$                 | 0.2                  |
| Voltage control filter time scale $\tau_v$ | $1/(50 \times 2\pi)$ |
| PLL controller $k_{PLL2}$                  | $6 \times 2\pi$      |
| PLL controller $k_i$                       | $0.6 \times 2\pi$    |
